Metabolism and nitrogen fixation studies with *Hyphantria* caterpillars. J. Balogh and G. Gere (Eotvos-Univ., Budapest). *Acta Biol. Sci. Hung.* 4, 431-52 (1953) (in German); cf. Tóth, et al., *C.A.* 37, 0348; Franz and Leitenberger, *C.A.* 42, 00286; Peklo and Satava, *C.A.* 43, 3531e.—A study was made of over 7000 American white tiger moth caterpillars (*Hyphantria cunea*) (1) with respect to (1) metabolic efficiency in the life-span of 1, (2) metabolic efficiency in each of 3 contiguous phases of the life-span of 1 (to the 33rd day), (3) N metabolism with special attention paid to chitin formation and fixation of atm. N. Methods used include semimicro-Kjeldahl with Hg catalyst (for N); Soxhlet extr. (4-8 hrs.) of lipides with petr. ether, and digestion of the organism at room temp. in 10% KOH for 10-12 days, followed by filtration, washing of the residue (chitin), and detn. of N content. The caterpillars were fed on leaves of *Acer negundo*. A table is given, with evidence of high metabolic efficiency over the entire life-span. Tables present total wt. gain (known amt. of food) and water and lipide content of animals. The chitin content is described as low. Evidence is presented that the animal has higher N content than that accounted for by the total food ingested, thus indicating fixation of atm. N.

HUNGARY/Physical Chemistry. Electrochemistry. D

Abstr Jour: Ref Zhur-Khim., No 5, 1959, 14778.

Author : Cseh Istvan, Balogh Janos, Kiss L.  
Inst :  
Title : The Dissolution of Zinc in Weak Hydrochloric and Sulphuric Acids.

Orig Pub: Magyar kem. folyoirat, 1958, 64, No 6, 185-191.

Abstract: The dissolving rate (DR) of electrolytic Zn (99.98%) in 0.001-0.05 n HCl and  $H_2SO_4$  has been studied. DR does not vary with time (with the exception of the initial induction period) and rises with the increase of the  $H^+$ -ion concentration. A periodical change of the solution during the test decreases DR, especially at low concentrations. The dark-gray

A newborn baby, 2 hr. old, developed haematuria and oedema of the renal regions. The child died on the 4th day of life. The clinical diagnosis made was thrombosis of the renal veins; post-mortem examination confirmed this diagnosis. It is thought that this type of thrombosis is caused by histaminic substances which affect the vascular endothelium.

Fogorvosi Szemle, Budapest, 1948, 41/11 (321-327)  
Abst: Exc. Med. Iv, Vol. 11, No. 4, p. 459

BALOGH K. A fogaszat kozegeszsegugyi jelentosege es korszeru fedalata (Eredeti kozlemenyek) The social importance and tasks of stomatology Forgorvosi Szemle, Budapest (Hungary) 1947, 40/3 (65-68)

The sphere of activity of Public Health institutions is not therapeutic but prophylactic. Dentists are largely responsible for the unsatisfactory relations between Public Health work and dentistry, mainly because dentistry-as a special branch of medical science-was either unable or neglectful to create a methodical and efficacious system of prevention of disease of teeth and the oral cavity. The significance of dentistry within the domains of Public Health is considerably increased by the fact that it deals with the most common and widespread ailment, i.e. dental caries. The Hungarian Public Health Service recognized the significance of dentistry by introducing the institution of School Dentistry i.e. free dental clinics in schools, mostly in larger cities as yet. For the country population and among the industrial and farm-workers, who live far from large cities, there exists a general hygienic problem; the condition of the teeth and oral cavity, which are in close connection with general prevention of various diseases. Outlines of the tasks of stomatology are as follows: (1) Professional education; (2) public health problems; (3) scientific works in dentistry; (4) social and economic problems of dentists; (5) publicity; (6) organization. Number (2) includes three groups: (1) Prophylaxis for children under two years of age; (2) prevention from the age of two years on; (3) dental care.

These tumours seldom occur in infancy. Their number increases, however, between 4 and 13 yr. The development of the tooth germs stimulates and induces neoplastic growth in the surrounding tissues. Tumours of mesenchymal origin are more frequent; their radioresistance might change after some years.

Inst :  
Title : "Sterogenol" Application in Medicine.  
Orig Pub : Orv. hetilap, 1955, 96, No 30, 820-824  
  
Abstract : Sterogenol - a cationic purifier of Hungarian manufacture  
is recommended in the form of aqueous solution for the  
sterilization of hands and mouth areas pre-operatively,  
materials used in stomatology for the preparation of im-  
pressions, materials for suture. It does not corrode  
the nozzle or needle; the solution which remains in the  
needles after boiling does not produce undesirable local  
effects.

The effect of goitrogens on oxygen consumption and body temperature of albino rats. László Bakogh, Sándor Donhoff, Pongrácz Jilly, and Gyula Mestyan (Univ. Pécs, Hung.). *Kísérleti Orvostudomány* 2, 81-81 (1950). In the hrs. following administration 0.1 g./kg. methylthiouracil or 0.01-2 g./kg. aminothiazole O<sub>2</sub> consumption showed larger fluctuations than in the preexpt. period. Normal animals generally showed a lasting increase. In acute expts. aminothiazole diminished the rate of metabolism and body temp., and sometimes a short initial increase was observed. Thyroidectomized or hypophysectomized animals showed definite decreases both in O<sub>2</sub> consumption and body temp.

**Hormonal mechanism of the second chemical heat regulation.** L. Balogh, Sz. Donhofer, Gy. Mestyan, and T. Pap (Univ. Pecs, Hung.). *Endocrinology* 28, 284-9 (1951).-- The O consumption of animals made hyperthermic by the surrounding temp. then transferred to an ordinary temp. is lower than that previously found at the ordinary temp. The sera of such hyperthermic animals also cause a lowering of the metabolism. Since it is possible to produce this effect even a long time after the removal of the thyroid or after long administration of methylothiouracil, it is doubtful if the thyroid hormone is involved. Furthermore, the effect of the "warm" serum or of thyrothylin in thyroid extracts is to raise not to lower the O consumption of rats without thyroids, and thus differs from the "second" chem. heat regulation in which the thyroid plays no significant role.

The action of the sodium salts of benzoic and salicylic acids and their *p*-amino derivatives and salicylamide on the consumption of oxygen and the body temperature in rats. L. Balogh, Sz. Donhofer, Gy. Mestyan, T. Pap, and I. Torn (Univ.-Pecs, Hung.). *Arch. exp. Path. Pharmacol.* 214, 299-307(1952).—The subcutaneous injection of Na benzoate (0.08-0.12 g./male rat) or Na *p*-aminobenzoate (0.1-0.2 g.) resulted in a 0-35% decrease in the O consumption and a 0-1.8° drop in rectal temp. The max. change was noted about 3 hrs. after the injection, and thyroidectomy had no influence on the results. The injection of 0.015-0.08 g. Na salicylate caused a max. drop in body temp. of 1.8°, but the O consumption was increased by as much as 79%. Na *p*-aminosalicylate (0.075-0.14 g.) and salicylamide (0.10 g.) gave the most marked lowering of body temp. (0.8-3.8°) and a decrease in O consumption of 0-47%.

Inst : Academy of Sciences of Hungary.  
Title : Quick Determination of the Iodine Content of Air.

Orig Pub: Acta physiol. Acad. scient. hung., 1958, 14, No 1, 7-11.

Abstract: For the determination of the content of iodine in air by the iodometric method at the concentrations of iodine of about 0.4  $\mu$  per cub.m, it is necessary to take a sample of air of 1 to 10 cub.m, which requires several hours. A rapid method of determination of the content of iodine in air is proposed. This method is based on the application of the cerium-catalytic method (described by Sandell and Kolthoff), which makes it possible to reduce

the time necessary for taking the sample of air to 40 min. 50 to 200 liter of the air under investigation is passed at the rate of 4 liter per min. through a pipe with a glass filter filled with 10 ml of an absorbing solution, after which the solution is sucked off into a receiver. 5 ml of 2.4 N HCl and 3.6 ml of the solution to be tested are placed into each of two test tubes and the mixture is adjusted to pH = 7 to 8 with 3.5% solutions of  $\text{Na}_2\text{SO}_3$  in 3.3 N NaOH.  $\text{Na}_2\text{SO}_3$  is decomposed with 1 ml of 7.0 N  $\text{H}_2\text{SO}_4$  and  $\text{SO}_2$  is eliminated by blowing iodine-free air through it. Then 1 ml of 7.0 N  $\text{H}_2\text{SO}_4$  and about 0.4% of  $\text{Na}_2\text{AsO}_3$  are introduced into each test tube. Having added 1 ml of about 2%  $\text{NH}_4\text{Ce}(\text{SO}_4)_2$  into one of the test tubes, readings are taken on a photometer of Hawemann with a

blue filter (reading  $S_1$  for the solution containing Ce and reading  $V_1$  for the solution free from Ce). After having allowed the solutions to stand in a water bath at  $35^\circ$  for 25 min., the reading is repeated ( $S_2$  and  $V_2$ ). The content of iodine in the sample is determined by the result calculated from the formula  $(V_1 - V_2) - (S_1 - S_2)$  using a calibration curve. - V. Sin'kovskiy.

"Correlation Between the Gaseous Iodine and "Complex Iodine" Content of Air and the Energy Metabolism of the Rat"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement to Vol 22, 1963; pp 20-21.

Abstract [Author's English summary, modified]: Climatochemical investigations have substantiated the view that besides gaseous iodine, the air also contains "complex" iodine, not demonstrable by reactions requiring the binding of iodine. When the complex iodine content was high, the energy metabolism of the rat dropped by about 30 percent.

"Cyanide Poisoning in a Child."

Budapest, Orvosi Hetilap, Vol 104, No 37, 15 Sept 63, pages 1756-1757.

Abstract: [Authors' Hungarian summary] The authors describe the successful treatment of cyanide poisoning of a 5 year-old child. Sodium nitrosum and sodium thiosulfate treatment was administered. The methemoglobinemia which arose as a result of the treatment was combatted by the withdrawal of 500 ml and transfusion of 700 ml blood. The literature on cyanide poisoning is reviewed and attention is called to exchange transfusions as a mode of treatment. 1 Hungarian, 12 Western references.
